EXPERIENCE

Apple

Software Engineer | IS&T, ETS Emerging Tech

Jun 2025 – Present

Enterprise API Platform

- Built a pre-production multi-tenant service mesh with a Go control plane and dynamic Envoy sidecars. Delivered approval-driven cross-cluster routing over gRPC, token revocation, and a live topology and tracing UI.
- Owned configurable build-once/promote-many CI/CD targeting EKS and other cloud instances. Gated deployment on matching immutable images and charts, with per-component versions, promotion, and rollback.
- Automated full-stack regression environments with snapshot-restored databases and resource cleanup; a verified provision, API/UI regression, and teardown run completed in approximately 17 minutes.
- Reduced a 2,543-test backend suite from 170 seconds to 16.5 seconds by isolating JVM-dependent tests and reusing forks, preserving test count and line coverage.
- Implemented server-side API specification validation, constrained proxy routing, and per-environment machine-to-machine gateway authentication within a shared backend codebase.

Production Reliability & Maintenance

- Maintain a system that automatically removes personal information from diagnostic reports. Collaborate with partner engineering teams on production fixes and migration to a managed cluster.

Observability

- Built OpenTelemetry instrumentation and telemetry query APIs with enforced attribute redaction, bounded-cardinality metrics, and end-to-end validation.

Lockheed Martin Space

Software Engineering Intern

Jun 2024 – Jun 2025

- Built an expert search and review-assignment application to replace spreadsheet coordination, owning architecture, UI, backend APIs, server provisioning, security reviews, and deployment.
- Integrated data sources with Next.js, TypeScript, Prisma, and Supabase; deployed on Linux behind Nginx.

AI/ML Research Intern

Jun 2023 – Oct 2023

- Researched low-light object detection with TensorFlow, Keras, and OpenCV; developed a custom data loader and evaluated data augmentation and hyperparameter tuning.

HaptX

IT Engineering Intern

Mar 2023 – Jun 2023

- Implemented geographic access restrictions and authentication policies; built login-activity and policy-enforcement analytics with Microsoft Azure and Intune.

Cal Poly ITS

Junior Security Operations Center Analyst

Jun 2022 – Feb 2023

- Built a Python Slack bot integrated with Splunk SOAR to automate phishing, suspicious-login, and account workflows, reducing analyst processing time from several minutes to under one minute.

EDUCATION

California Polytechnic State University, San Luis Obispo

2025

Bachelor of Science in Computer Science | Cum Laude

PROJECTS

- **Homelab:** Operate a Proxmox homelab hosting self-managed applications and agents.

TECHNICAL SKILLS

Languages: Go, Python, TypeScript, SQL, Java, C, C++

Systems & Web: Kubernetes, EKS, Docker, Envoy, Spinnaker, OpenTelemetry, Jaeger, Linux, React, Next.js, Node.js

AI/ML: TensorFlow, Keras, OpenCV, Jupyter
